SENIOR LIVING

Predictive Insight for Senior Living

When planning and delivering care to residents, we adhere to Ben Franklin's axiom: An ounce of prevention is worth a pound of cure.

We know the potential results of falls, ER visits and hospitalizations. We also know that in many cases, these incidents don't just "happen." There are often changes – such as the way you're walking or how you're sleeping – that may indicate increasing risk of illness or injury.

With access to detailed, accurate and timely information, we can make observations sooner and work to intervene *before* something happens.

How we deliver proactive care

Our community relies on **STANLEY Healthcare's Foresite solution**, which uses state-of-the-art monitoring to help us proactively manage and anticipate our residents' care needs.

Without ever touching you – or compromising your privacy – Foresite continuously monitors 30 different factors, including heart rate, respiratory rate, bed restlessness, gait, motion and activity, and many more.

This continuous monitoring helps us identify and address your individual risks for certain types of illness and injury. With those insights, we can make changes in your care and/or your environment to reduce the risk of a fall or other incident.

Should a fall or other adverse event occur, the Foresite technology also provides tangible information to yield a better understanding what led up to the incident. We can then determine the best possible course of action for treating any illness or injury and preventing it from happening again.

Make the best choice

The best way to treat illnesses and other negative life events is to prevent them from happening in the first place. That is the level of care we aim for – and that Foresite is designed to support.
